

## Partition WLine

Designed with an aluminium profiled rim and double glazing laminates joined together by transparent PVC bits, the WLine partition is only 59mm thick and allows for better acoustic performance compared to the ALGlass, still maintaining the transparency and lightness features that characterize them.

The WLine partition can also be coated with 19mm panels in bi-laminated chipboard or natural wood veneer, with inner insulation of compressed soft foam of 15mm/60kg/m<sup>3</sup> or similar material. You can also incorporate wood panels type CF Texturas® and Acústica XXI®, as well as PVC screens, making it possible to incorporate in the same space several different types of partitions with different acoustic insulation, but with a common finishing.

As a versatile partition, it allows various configurations and the incorporation of furniture.

Gliding doors:

Tempered 10mm glass doors along the height of the partition, up to 3 meters. You can also incorporate opaque wooden or semi-glazed 38mm doors. Locks and hinges according to market availability.

Sliding doors:

You can incorporate wooden or glass gliding doors.

All profiles are in aluminium alloy ENAW - 6060 (AL Mg Si) according to Standards EN 573-3 and EN 755-2.
